# 5800RP

ADEMCO's 5800RP is a wireless repeater that extends the range of 5800 series RF devices. For installations that require increased RF range, the 5800RP eliminates the need to run wires to a remotely installed secondary receiver and also eliminates the need to upgrade to a larger control panel that supports two receivers.

### FEATURES:

- Extends the range of 5800 series of wireless devices
- Receives alarm, status and control messages from 5800 RF devices, and repeats these messages to the control panel via the primary receiver
- Compatible with all 5800 wireless devices (including bi-directional devices)
- UL residential burglary listed
- AC powered with a six-hour battery back up
- Tamper protected

### KEY BENEFITS:

- Provides extended coverage, reduces labor costs, saves installation time
- Saves wire run to a secondary receiver at a remote location
- Eliminates the need to upgrade to a control panel that support two receivers

### SPECIFICATIONS:

**Dimensions:**  
 • 7.3/8" W x 4.3/8" (10.7/8" w/antenna) H x 1.7/16" D.  
 • 188mm W x 11.2mm H (277mm w/antenna) x 37mm D.

**Input Voltage:**  
 • 12VDC or 9VAC, 15VA. (from separate power supply such as ADEMCO 1332).

**Current:**  
 • 80mA

**Battery Pack:**  
 • Rechargeable, part number K0257

**ORDERING:**

Part No.	Description
5800RP	Wireless Repeater

**Compatibility:**  
 Compatible with 5811EN, 6123RF, 6150RF, 5883H and Lynx

165 Essex Way, Spessard, NY 11791

## ADEMCO 5819WHS/5819BRS SHOCK PROCESSOR TRANSMITTER

N7491-1V2 6/06 Rev. A

### INSTALLATION AND SETUP GUIDE

#### GENERAL INFORMATION

The ADEMCO 5819WHS/5819BRS Shock Processor Transmitters each feature a built-in shock sensor and are intended for use only with alarm systems that support ADEMCO 5800 Series wireless devices. The built-in shock sensor is used to detect forcible attack upon the surface to which it is mounted. It is designed to protect window and door surroundings. The sensor is electrically normally closed, but, under shock conditions, goes open-circuit momentarily.

The 5819 supports three unique zones, known as "loops".  
 Loop 1 = built-in shock sensor loop, factory-wired to TB1 (normally closed)  
 Loop 2 = built-in magnetic reed switch in conjunction with a magnet (normally closed)  
 Loop 3 = externally wired, closed-circuit contact loop connected to TB2

The 5819WHS/5819BRS also has a built-in cover tamper switch that activates when the cover is removed and sends a "chuck" message to the control.

#### AREA OF SHOCK PROTECTION

Typical area of coverage is 10-12 feet (5-6 foot radius). This can vary, depending on the type of window or other mounting surface to which the unit is mounted.

#### MOUNTING

The description that follows assumes that the unit will be mounted as shown in Diagram 1 below, with the magnet (if used) located to the left of the unit. The unit can be installed in any direction, as long as the relationship of the unit to the magnet is maintained. In addition, the arrow embossed on the built-in shock sensor must face UP when the unit is mounted.

To change the shock sensor's orientation, gently push the sensor away from its mounting hole until it can rotate freely. Twist the sensor until the arrow is pointing UP when the detector is in the desired mounting position; then gently push the sensor until it is fully seated in its mounting hole.

Before mounting the transmitter permanently, conduct Go/No Go tests (see control's instructions) to verify adequate signal strength. Reorient or relocate the transmitter if necessary.

1. Remove transmitter's cover by inserting the flat blade of a small screwdriver into the pry-off slot nearest to the cover's decorative ribs, and twisting the blade.

2. If you are using a wired contact loop, cut the thin "breakout" area provided at the lower edge in the case wall to allow wire entry.
3. Mount the case back to a solid surface using the two mounting holes shown in Diagram 1 below, and the pan-head screws provided.
4. If you are using the unit's reed switch, mount a 5899 Magnet (obtained separately) adjacent to the alignment marks on the case (see Diagram 1 below).
5. If you are using an external contact, remove the battery (if installed) and connect a normally closed contact to TB2.

**NOTE:** If the contact loops are not used, make no connection across the terminals.

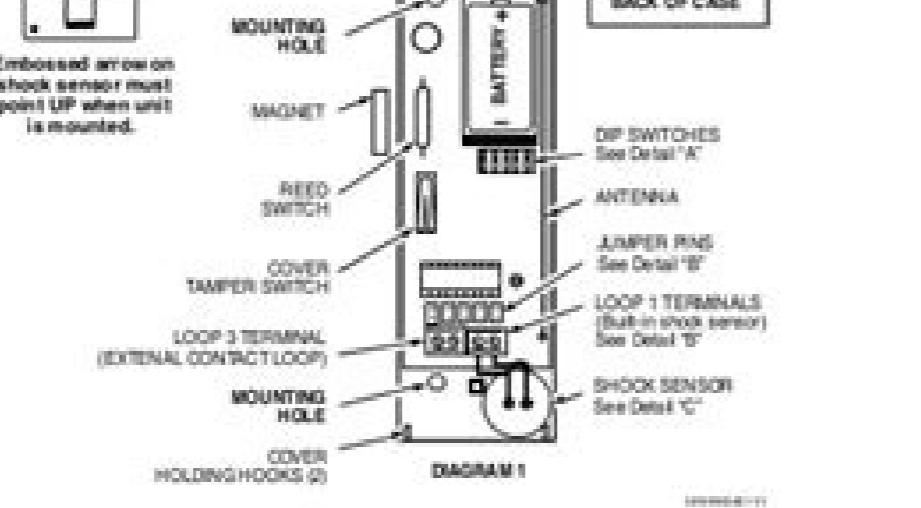

**TABLE 1**

SWITCH	RESPONSE TIME
SW1 (Most Sensitive)	1ms
SW2	5ms
SW3	5ms
SW4	10ms
SW5 (Least Sensitive)	20ms

Specifications	13

**Introduction**  
The Honeywell TDC 3000 Basic Controller consists of a microprocessor-based card file (model CB120) providing multifunctional process control, and a dedicated terminal panel for process signal interconnection. The controller is configured by the user to provide precision automatic control for 8 independent or cascaded control loops. A reserve controller capability is available in the Basic Controller Model CB125.

**Functional Description**  
The Basic Controller (Figure 1) is equivalent to eight conventional multi-mode multi-functional controllers. The electronics are packaged in a single card file and the process interconnection is terminated at the printed wire terminal panel.

Eight sets of process signals, hardwired to the terminal panel, are interrogated individually by the controller file, and a customer-selected equation or algorithm is applied to each. This action results in eight discrete analog output control signals which are routed back to the terminal panel for distribution to the respective control elements.

The process input signals, a code relating the selected algorithm, and the resultant output signals are stored digitally in designated controller file areas referred to as computational slots. A slot, therefore, contains the required data necessary for controller action.

Algorithms are pre-defined and are resident in the controller file. They contain a mathematical expression in which the process variable (PV), set point (SP) and time (t) are the variables in the equation, and the resultant is the control output (C), where:  
C = f(PV, SP, t)
